CASE 722AC

### Description

The FUSB301 is a fully autonomous Type-C controller optimized for <15 W applications. The FUSB301 offers CC logic detection for Source Mode, Sink Mode, Dual Role Port Mode, accessory detection support, and dead battery support. The FUSB301 features an external switch pin (SS\_SW) to enable an external USB Super Speed Switch without interrupting the processor. The FUSB301 features an extremely low power disable mode as well as low power during normal operation. It is available in an ultra thin, 10-Lead TMLP package.

### Features

- Fully Autonomous Type-C Controller
- Supports Type-C Versions 1.1 and 1.0
- V<sub>DD</sub> Operating Range, 3.0 V – 5.5 V
- Low Disable Power: I<sub>CC</sub> = 2 μA (Max.)
- Low Standby Power: I<sub>CC</sub> = 7 μA (Max.)
- Dual Role Port Mode with Optional Accessory Support
- Capable of Supporting Try.SNK and Try.SRC
- Super Speed Switch Control
- Dead Battery Support (SINK Support when No Power Applied)
- 2 kV HBM ESD Protection
- Small Packaging, 10 Lead TMLP (1.6 mm × 1.2 mm × 0.375 mm)

### Application

- Smartphones
- Tablets
- Notebooks
- Ultra Portable Applications

## PIN DESCRIPTIONS

Pin #	Name	Type	Description
<b>USB Type-C Connector Interface</b>			
6, 7	CC1, CC2	I/O	Type-C Configuration Channel
8	VBUS	Input	VBUS input pin for attach and detach detection
4	GND	Ground	Ground
<b>Power Interface</b>			
5	VDD	Power	Input Supply Voltage
<b>Signal Interface</b>			
1	SDA	Input	I <sup>2</sup> C serial data signal to be connected to the I <sup>2</sup> C master
2	SCL	Open-Drain I/O	I <sup>2</sup> C serial clock signal to be connected to the I <sup>2</sup> C master
3	ID	Open-Drain Output	Used to Identify if connected device is Source to Sink. The ID Pin can be used to interface with USB 2.0 Input on the processor.
9	SS_SW	CMOS Output	External Super Speed Switch control without processor interrupt.
10	INT_N	Open-Drain Output	Active Low open drain interrupt output used to prompt processor to read I <sup>2</sup> C register bits.

### Dead Battery

If power is not applied to FUSB301 and it is attached to a Source device, then the Source would pull up the CC line connected through the cable. The FUSB301 in response would turn on the pull-down that will bring the CC voltage to a range that the Source can detect an attach and turn on VBUS.

### Power Up, Initialization and Reset, Interrupt Operation

When power is first applied, the FUSB301 will power up in Sink mode with all interrupts masked. The local processor must configure the FUSB301 to the desired mode and clear the global interrupt mask bit, INT\_MASK. The INT\_N pin is an active low, open drain output. This pin indicates to the host processor that an interrupt has occurred in the FUSB301 which needs attention. The INT\_N pin is in a high impedance state by default after power-up or device reset, and the global interrupt mask (INT\_MASK in Control register) is set. After INT\_MASK bit is cleared by the local

processor, the INT\_N pin stays high impedance in preparation of future interrupts. When an interruptible event occurs, INT\_N is driven LOW and is in a high impedance state again when the processor clears the interrupt by reading the interrupt registers. Subsequent to the initial power up or reset; if the processor writes a “1” to global interrupt mask bit when the system is already powered up, the INT\_N pin stays in a high impedance state and ignores all interrupts until the global interrupt mask bit is cleared. If an event happens that would ordinarily cause an interrupt when the global interrupt mask bit is set, the INT\_N pin goes LOW when the global interrupt mask is cleared.

### SuperSpeed Switch Control

For applications that require a SuperSpeed USB switch (USB3.1 Gen 1), the SS\_SW pin will autonomously control the USB switch, such as the FUSB340TMX, without interrupting the processor.

2. A fast-mode I<sup>2</sup>C bus device can be used in a standard-mode I<sup>2</sup>C bus system, but the requirement t<sub>SU;DAT</sub> ≥ 250 ns must be met. This is automatically the case of the device does not stretch the LOW period of the I2C\_SCL signal. If such a device does stretch the LOW period I2C\_SCL signal, it must output the next data bit to the I2C\_SDA line t<sub>r\_max</sub> + t<sub>SU;DAT</sub> = 1000 + 250 = 1250 ns (according to the standard-mode I<sup>2</sup>C bus specification) before the I2C\_SCL line is released.
3. C<sub>b</sub> equals the total capacitance of one bus line in pF. If mixed with high-speed devices, faster fall times are allowed according to the I<sup>2</sup>C specification.

**Figure 4. Definition of Timing for Full-Speed Mode Devices on the I<sup>2</sup>C Bus**

**I<sup>2</sup>C INTERFACE**

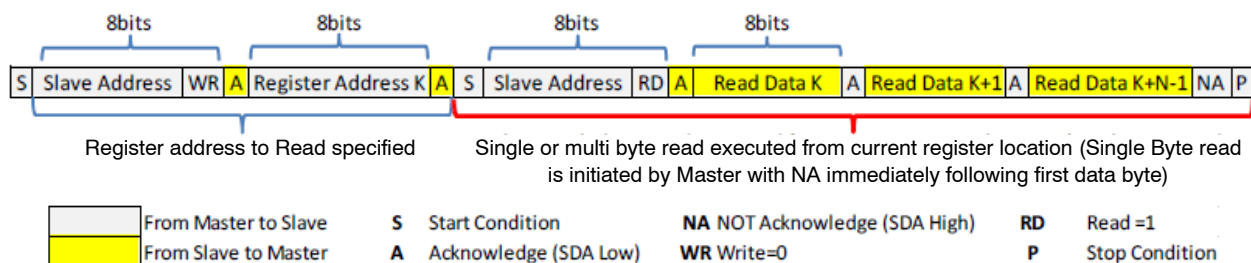

The FUSB301 includes a full I<sup>2</sup>C slave controller. The I<sup>2</sup>C slave fully complies with the I<sup>2</sup>C specification version 6

requirements. This block is designed for fast mode. Examples of an I<sup>2</sup>C write and read sequence are shown Figure 5 and Figure 6 respectively.

NOTE: Single Byte read is initiated by Master with P immediately following first data byte.

**Figure 5. I<sup>2</sup>C Write Example**

NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed.
