

#### **General Description**

The MAX3969 is a recommended upgrade for the MAX3964 and MAX3968. The MAX3964A limiting amplifier, with 2mV<sub>P-P</sub> input sensitivity and PECL data outputs, is ideal for low-cost ATM, FDDI, and Fast Ethernet fiber optic applications.

19-1314; Rev 5; 8/06

EVALUATION KIT

The MAX3964A features an integrated power detector that senses the input-signal power. It provides a received-signal-strength indicator (RSSI), which is an analog indication of the power level and complementary PECL loss-of-signal (LOS) outputs, which indicate when the power level drops below a programmable threshold. The threshold can be adjusted to detect signal amplitudes as low as 2.7mV<sub>P-P</sub>. An optional squelch function disables switching of the data outputs by holding them at a known state during an LOS condition.

The MAX3968 provides the same functionality as the MAX3964A, but has data-output edge speed suitable for ESCON and 266Mbps fibre channel applications.

The MAX3964A/MAX3968 are available in die form, as tested wafers, and in 20-pin QSOP packages. The MAX3964AETP is available in a 20-pin thin QFN package.

## **Applications**

125Mbps FDDI Receivers 155Mbps LAN ATM Receivers Fast Ethernet Receivers **ESCON Receivers** 155Mbps FTTx Receivers

#### Features

- ♦ Single Supply: +3.0V to +5.5V
- ♦ 2mV<sub>P-P</sub> Input Sensitivity
- ♦ 1.2ns Output Edge Speed
- ♦ Loss-of-Signal Detector with Programmable **Threshold**
- ♦ Analog Received-Signal-Strength Indicator
- **♦ Output Squelch Function**
- ♦ Compatible with 4B/5B Data Coding

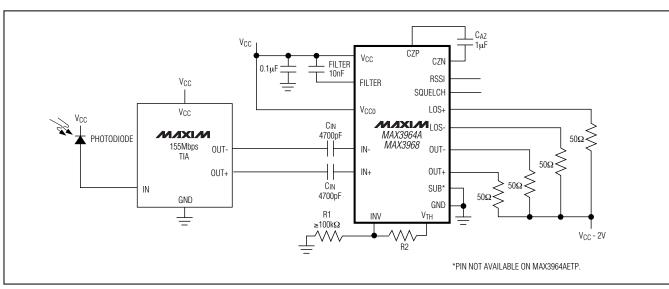

#### **Ordering Information**

| PART         | TEMP RANGE     | PIN-PACKAGE   |
|--------------|----------------|---------------|
| MAX3964AETP  | -40°C to +85°C | 20 Thin QFN** |
| MAX3964AETP+ | -40°C to +85°C | 20 Thin QFN** |
| MAX3964AC/D  | -40°C to +85°C | Dice*         |
| MAX3968CEP   | 0°C to +70°C   | 20 QSOP       |
| MAX3968C/D   | 0°C to +70°C   | Dice*         |

<sup>\*</sup>Dice are designed to operate over a 0°C to +100°C junction temperature (Tj) range, but are tested and guaranteed only at TA  $= +25^{\circ}C$ 

Pin Configurations and Selector Guide appear at end of data sheet.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

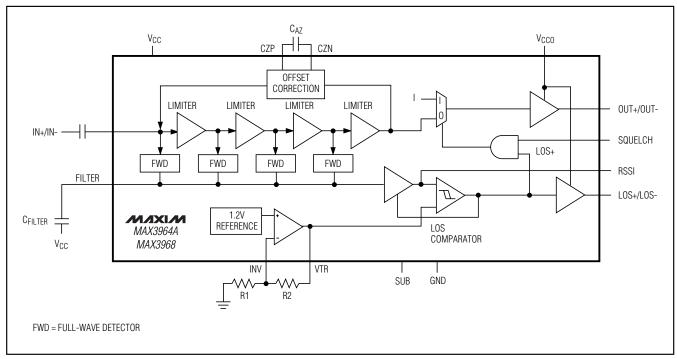

Figure 1. Functional Diagram

## **Detailed Description**

The MAX3964A contains a series of limiting amplifiers and power detectors, offset correction, data-squelch circuitry, and PECL output buffers for data and loss-of-signal (LOS) outputs. The MAX3968 provides PECL LOS outputs with data outputs suitable for 266Mbps. Figure 1 shows a functional diagram of the MAX3964A/MAX3968.

#### **Limiting Amplifiers**

A series of four limiting amplifiers provides gain of approximately 65dB.

#### **Power Detector**

Each amplifier stage contains a full-wave logarithmic detector (FWD), which indicates the RMS input signal power. The FWD outputs are summed together at the FILTER pin where the signal is filtered by an external capacitor (CFILTER) connected between FILTER and VCC. The FILTER signal generates the RSSI output voltage, which is proportional to the input power in decibels. When LOS+ is low, VRSSI is approximated by the following equation:

 $V_{RSSI}(V) = 1.2V + 0.5log(V_{IN})$ 

where V<sub>IN</sub> is measured in mV<sub>P-P</sub>.

This relation translates to a 25mV increase in  $V_{RSSI}$  for every 1dB increase in  $V_{IN}$  (25mV/dB). The RSSI output is reduced approximately 120mV when LOS+ is asserted.

#### **PECL Outputs**

The data outputs (OUT+, OUT-) and the MAX3964A/ MAX3968 loss-of-signal outputs (LOS+, LOS-) are supply-referenced PECL outputs. Standard PECL termination at each output of  $50\Omega$  to (V<sub>CC</sub> - 2V) is recommended for best performance.

#### **Input Offset Correction**

A low-frequency feedback loop around the limiting amplifier improves receiver sensitivity and powerdetector accuracy. The offset-correction loop's bandwidth is determined by an external capacitor (CAZ) connected between the CZP and CZN pins.

The offset correction is optimized for data streams with a 50% duty cycle. A different average duty cycle results in increased pulse-width distortion and loss of sensitivity. The offset-correction circuitry is less sensitive to variations of input duty cycle (for example, the 40% to 60% duty cycle encountered in 4B/5B coding) when the input is less than 30mV<sub>P-P</sub>.

#### Loss-of-Signal Comparator

The LOS comparator indicates when the input signal power is below the programmed LOS threshold. To ensure supply and temperature independence, VTH is generated by a 1.2V bandgap reference. The op amp's external gain-setting resistors (R1 and R2) can be chosen to set V<sub>TH</sub> between 1.2V and 2.4V. To ensure chatter-free operation, the LOS comparator is designed with approximately 5dB of hysteresis.

#### Squelch

The squelch function disables the data outputs by forcing OUT- low and OUT+ high during a LOS condition. This function ensures that when there is a loss of signal, the limiting amplifier (and all downstream devices) does not respond to input noise or corrupt data. Connect SQUELCH to GND or leave it unconnected to disable squelch. Connect SQUELCH to  $V_{\rm CC}$  to enable data squelching.

## **Applications Information**

#### **Program the LOS Threshold**

Figure 2 provides information for selecting the LOS threshold voltage (VTH). If R1 is  $100k\Omega$  and if the responsivities of the photodiode and preamplifier are known, then the value of R2 can be selected from Figure 2 to provide LOS assert at the desired input power.

#### **Select Capacitors**

A typical MAX3964A/MAX3968 implementation requires four external capacitors (C<sub>AZ</sub>, C<sub>FILTER</sub>, and two input coupling capacitors). For all applications up to 266Mbps, Maxim recommends the following:

 $C_{AZ} = 1\mu F$   $C_{FILTER} = 10nF$  $C_{IN} = 4700pF$ 

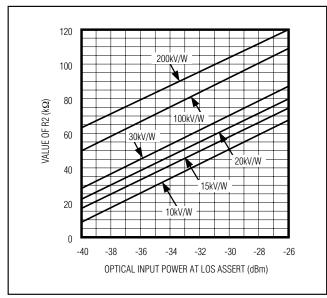

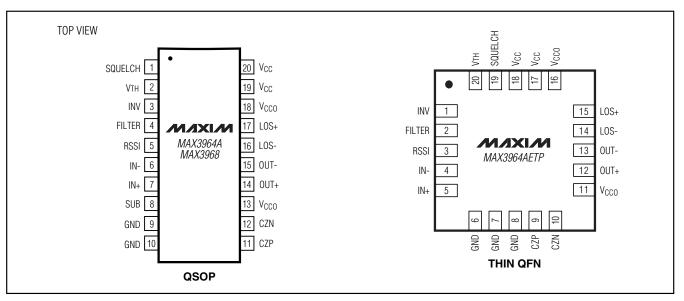

Figure 2. LOS Assert Programming Resistor vs. LOS Assert Power (for Various PIN-TIA Gains )

#### Wire Bonding

For high-current density and reliable operation, the MAX3964A series uses gold metalization. Diepad size is 4mils square with a 6mil pitch. Die thickness is 15mils.

## Pin Configurations

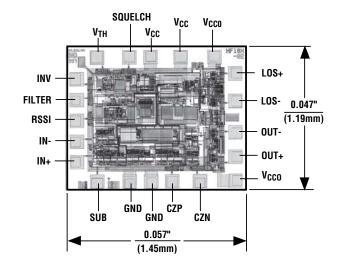

#### **Selector Guide**

| PART      | DATA RATE (Mbps) | LOS OUTPUTS |
|-----------|------------------|-------------|
| MAX3964A* | 125 to 155       | PECL        |
| MAX3968   | 125 to 266       | PECL        |

<sup>\*</sup>The MAX3964A is functionally equivalent to MAX3964, but offers slightly improved ESD tolerance. The MAX3969 is a recommended upgrade for the MAX3964, MAX3964A, and MAX3968.

#### NOTES:

- 1. DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- 2. ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- 3. N IS THE TOTAL NUMBER OF TERMINALS.
- THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO
  JESD 95-1 SPP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN
  THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
- DIMENSION 6 APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TIP.
- $\triangle$  nd and ne refer to the number of terminals on each D and E side respectively.
- 7. DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.
- COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
- 9. DRAWING CONFORMS TO JEDEC MO220, EXCEPT FOR T2444-3, T2444-4 AND T2844-1.
- MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
- 11. COPLANARITY SHALL NOT EXCEED 0.08mm
- 12. WARPAGE SHALL NOT EXCEEND 0.10mm

  LEAD CENTERLINES TO BE AT TRUE POSITION AS DEFINED BY BASIC DIMENSION "6", ±0.05.
- 14. NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY

-DRAWING NOT TO SCALE-

#### **Revision History**

Rev 0; 10/98: Initial data sheet release.
Rev 1; 10/02: Added MAX3964ETP.

Rev 2; 5/03: Added package code for TQFN (page 1); updated package drawing (pages 11, 12).

Rev 3; 9/04: Added MAX3964A (pages 1 to 13).

Rev 4; 2/06: Added lead-free package information to Ordering Information table (page 1).

Rev 5; 8/06: Removed references to MAX3964 and MAX3965, TTL Loss of Signal, GNDO; updated CAZ

value to 0.1µF and CIN from 10nF to 4700pF. Updated Typical Application Circuit.

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
